CTL in cancer patients. The present sequence represents a peptide from

the present invention

```
The present invention describes peptides recognising cancer cells with tumour specific cytotoxic T lymphocytes (CTL). The peptides recognising cancer cells with tumour specific CTLs are selected from: (1) peptides of sequences (AAG68066 to AAG68069); (2) peptides containing the above mentioned sequences; (3) peptides having 70 % or more of homogeneity with the above mentioned sequences; and (4) peptides with one or more deleted, substituted, added or inserted amino acid(s) of the above mentioned sequences, particularly those having recognising property due to HLA-A2402 binding CTL, especially having at least 5 amino acids, used for medicine, particularly anticancer agents, derived from antitumour antigenic peptides of lck, src family, SART-1, SART-3 or cyclophilin B genes. The antitumour peptides have cytostatic activities. The peptides are used for the treatment of cancer. The peptides cause activation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 8; Page 2; 14pp; Japanese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             JP2001245675-A.
                                                                                                                                                                                                        Sequence 9 AA;

This invention describes the novel use of interferons (IFNs) or DNAs capable of expressing the interferons and/or antigenic proteins (AP), antigenic peptides derived from the proteins or DNAs capable of expressing the antigenic proteins or peptides, in the manufacture of an agent for induction of antigen-specific T cells. The products of the invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antigen-specific T cells. The action of interferon-alpha (IFN-alpha) in a system for inducing specific cytotoxic T cell (CTL) by administering an antigenic peptide in an incomplete Freund's adjuvant (IFA) emulsion preparation form was evaluated. IFNs (or DNA encoding IFNs) are useful in the manufacture of a medicament for inducing antigen-specific T cells in an individual who has been administered with AP (or DNA encoding AP) or vice versa. The medicament is is useful for the treatment or prophylaxis of a tumor or a viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptides for recognizing cancer cells with tumor specific cytotoxic Tlymphocytes and for treating cancer.

The invention relates to a composition (I) comprising an immune effector cell and a cell penetrating peptide (CPP) associated with an antigen or antibody. Also included are (I) a vaccine comprising (I), CPP associated with an antigen, and a pharmaceutically acceptable carrier and (2) corprehensing a composition for a disease, by providing (I) and CPP corprehensing a composition for disease, and introducing the antigens associated CPP to (I), where antigen enters into the cell. The antigens corprehensive (CC are, for example, tumour antigen derived epitopes recognised by tumour corprehension is useful for enhancing immunity in an animal to a disease, by administering a mature dendritic cell comprising CPP cor II. The composition is useful for enhancing immunity in an animal to a disease, by administering a mature dendritic cell comprising CPP corprehensive both CD4+ and CD8+ T cells. It is also useful for treating a comcer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, uterine cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, uterine cancer, cervical cancer, ovarian cancer and pancreatic cancer).

The animal is further subjected to a cancer treatment including surgery,

The method comprises sampling of peripheral blood monocytes; stimulation of the collected peripheral blood monocytes with antigens without direct use of antigen presenting cells; and detection of T-cells specific to the antigen in the stimulated monocytes. The method is particularly used for the detection of cancer as it can be used in semi-quantitative determination of cancer specific T-cells. It can also be used for cancer vaccine therapy for patients with cervical or prostate cancer. The method can additionally be used to monitor of cellular immunity and cancer immune therapy by detection of specific T-cell frequencies. Sequences ABRR4380 represent HIA-A24 (human the antigen that a sequence and additionally be used to monitor of cellular immunity and cancer immune therapy by detection of specific T-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antigen specific T-cell; detection; diagnosis; cancer specific T-cell; cancer; tumour; cervical cancer; prostate cancer; cellular immunity; immune therapy; cytostatic; immunostimulant; vaccine; antigenic peptide; human; human leukocyte antigen; HIA-A24 epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 leukocyte antigen) peptides of human origin used in an example from the
radiation, chemotherapy or gene therapy. The administration of (I), preferably dendritic cell is prior to, subsequent to or concurrent with, the cancer treatment. The present sequence is a tumour antigen derived epitope for inclusion in the composition of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A detection method of antigen specific T-cells, comprises the use of plural antigenic peptides, useful in semi-quantitative determination of cancer specific T-cell frequencies and for monitoring cellular immunity.

The invention relates to allergic reaction suppressors, comprising a peptide which originates from the same antigenic substance as the antigenic substance inducing the (peptide-originated) allergic reaction, and containing an epitope different from the epitope participating in the induction of the allergic reaction and yet dos not induce the allergic reaction. The desensitizers or allergic reaction suppressors are useful for treating and preventing type I allergic diseases and in cancer vaccines for preventing or treating cancer. The allergic reaction suppressors are also useful for suppressing an allergic reaction or reducing immunoglobulin E antibody production, and for desensitization to antigens. This sequence represents a peptide used in the invention and corresponds to amino acids 91-99 of the cyclophilin B protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0

This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                  This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours

This invention describes the novel use of interferons (IFNs) or DNAs capable of antigenic peptides derived from the proteins or DNAs capable of expressing the antigenic proteins or DNAs capable of expressing the antigenic proteins or Deptides, in the manufacture of an agent for induction of antigen-specific T cells. The products of the invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antigen-specific T cells. The action of interferon-alpha (IFN-alpha) in a system for inducing specific cytotoxic crell (CTL) by administering an antigenic peptide in an incomplete or recell (CTL) by administering an antigenic peptide in an incomplete or administered with AP (or DNA encoding AP) or vice versa. The medicament con infectious disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptides for recognizing cancer cells with tumor specific cytotoxic T lymphocytes and for treating cancer.
                                                                                                                                                                                                                                     Use of antigenic proteins, peptides, interferon or their encoding DNA, in the manufacture of an agent for the induction of antigen-specific \ensuremath{\mathtt{T}}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antitumour; cancer; cancer cell recognition; antigenic; CTL; lck; src; tumour specific cytotoxic T lymphocyte; anticancer; SART-1; SART-3; cyclophilin B gene; HLA-A2402.

The present invention describes peptides recognising cancer cells with tumour specific CTLB are selected from: (1) peptides of cancer cells with tumour specific CTLB are selected from: (1) peptides of sequences (AAG68066 to AAG68069); (2) peptides containing the above mentioned sequences; (3) peptides having 70 % or more of homogeneity with the above mentioned sequences; and (4) peptides with one or more deleted, substituted, added or inserted amino acid(s) of the above mentioned sequences, particularly those having recognising property due to HLA-A2402 binding CTL, especially having at least 5 amino acids, used for medicine, particularly anticancer agents, derived from antitumour medicine agents, derived from antitumour peptides have cytostatic activities. The peptides are used for the treatment of cancer. The peptides cause activation of CTL in cancer patients. The present sequence represents a peptide from the present invention Sequence 9 AA;

Novel composition for treating a disease in an animal, comprises an immune effector cell and cell penetrating peptide associated with an antigen or antibody.

Disclosure; Page 17; 61pp; English.

The invention relates to a composition (I) comprising an immune effector cell and a cell penetrating peptide (CPP) associated with an antigen or antibody. Also included are (1) a vaccine comprising (I), CPP associated with an antigen, and a pharmaceutically acceptable carrier and (2) preparing a composition for a disease, by providing (I) and CPP associated with an antigen for disease, and introducing the antigen-

infiltrating lymphocytes (TIL) of HLA (human leukocyte antigen) class I of infiltrating lymphocytes (TIL) of HLA (human leukocyte antigen) class I or II. The composition is useful for enhancing immunity in an animal to a disease, by administering a mature dendritic cell comprising CPP associated with an antigen to disease, to the animal, such that following the administration, animal is protected from disease, where the animal comprises both CD4+ and CD8+ T cells. It is also useful for treating a disease (e.g. cancer, tumour, melanoma, thymoma, lymphoma, arcoma, lung cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, uterine cancer, cervical cancer, bladder cancer, kidney cancer, adenocarcinoma, breast cancer, prostate cancer, ovarian cancer and pancreatic cancer). The animal is further subjected to a cancer treatment including surgery, radiation, chemotherapy or gene therapy. The administration of (I), preferably dendritic cell is prior to, subsequent to or concurrent with, the cancer treatment. The present sequence is a tumour antigen derived epitope for inclusion in the composition of the invention associated CPP to (I), where antigen enters into the cell. The antigens

A detection method of antigen specific T-cells, comprises the use of plural antigenic peptides, useful in semi-quantitative determination of cancer specific T-cell frequencies and for monitoring cellular immunity.

Example 8; Page 10; 18pp; Japanese.

The invention relates to a method for the detection of antigen specific T cells in a blood sample involving the use of a plurality of antigenic peptides. The method comprises sampling of peripheral blood monocytes; stimulation of the collected peripheral blood monocytes with antigens without direct use of antigen presenting cells; and detection of T-cells specific to the antigen in the stimulated monocytes. The method is particularly used for the detection of cancer as it can be used in semi-quantitative determination of cancer specific T-cells. It can also be used for cancer vaccine therapy for patients with cervical or prostate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to allergic reaction suppressors, comprising a peptide which originates from the same antigenic substance as the antigenic substance inducing the (peptide-originated) allergic reaction, and containing an epitope different from the epitope participating in the induction of the allergic reaction and yet dos not induce the allergic reaction. The desensitizers or allergic reaction suppressors are useful for treating and preventing type I allergic diseases and in cancer vaccines for preventing or treating cancer. The allergic reaction suppressors are also useful for suppressing an allergic reaction or reducing immunoglobulin E antibody production, and for desensitization to antigens. This sequence represents a peptide used in the invention and corresponds to amino acids 84-92 of the cyclophilin B protein.
                                                                                                                                    ·

This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                    Cyclophilin B; human; tumour antigen peptide; cytotoxic T-cell; CTL; HLA antigen; diagnosis; tumour; therapy.

                                                                                                                                                                                                                    AAR72945-48 are tryptic fragments of E. coli PPIase-alpha (peptidyl prolyl cis trans isomerase). The E. coli PPIase-beta has a single mol. wt. of about 22 kDa and a single isoelectric point of about 9.7. The enzyme catalyses the isomerisation of prolyl peptide bonds in proteins and accelerates the folding of the protein. The inventors are claiming a PPIase-beta. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated on 16-OCT-2003 to standardise OS field)

New E.coli peptidyl prolyl cis trans isomerase alpha - used to accelerate the folding of proteins, partic. for activation of inactive recombinant
                                                                                                                                                                                                                                                                                                                                                                                  AAR72900-04 are tryptic fragments of E. coli PPIase-alpha (peptidyl prolyl cis trans isomerase). The E. coli PPIase-beta has a single mol. wt. of about 22 kDa and a single isoelectric point of about 9.7. The enzyme catalyses the isomerisation of prolyl peptide bonds in proteins and accelerates the folding of the protein. The inventors are claiming the PPIase-alpha. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.) RR field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cyclophilin B; human; tumour antigen peptide; cytotoxic T-cell; CTL; HLA antigen; diagnosis; tumour; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           capable of expressing the interferons and/or antigenic proteins (AP), antigenic peptides derived from the proteins or DNAs capable of expressing the antigenic proteins or peptides, in the manufacture of an agent for induction of antigen-specific T cells. The products of the invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antigen-specific T cells. The action of interferon-alpha (IFN-alpha) in a system for inducing specific cytotoxic T cell (CTL) by administering an antigenic peptide in an incomplete Freund's adjuvant (IFA) emulsion preparation form was evaluated. IFNS (or DNA encoding IFNS) are useful in the manufacture of a medicament for inducing antigen-specific T cells in an individual who has been administered with AP (or DNA encoding AP) or vice versa. The medicament is useful for the treatment or prophylaxis of a tumor or a viral infectious disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of antigenic proteins, peptides, interferon or their encoding DNA, the manufacture of an agent for the induction of antigen-specific T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to allergic reaction suppressors, comprising a peptide which originates from the same antigenic substance as the antigenic substance inducing the (peptide-originated) allergic reaction, and containing an epitope different from the epitope participating in the induction of the allergic reaction and yet dos not induce the allergic reaction. The desensitizers or allergic reaction suppressors are useful for treating and preventing type I allergic diseases and in cancer vaccines for preventing or treating cancer. The allergic reaction suppressors are also useful for suppressing an allergic reaction or reducing immunoglobulin E antibody production, and for desensitization to antigens. This sequence represents a peptide used in the invention and corresponds to amino acids 91-99 of the cyclophilin B protein with the phe at position 92 replaced by a Tyr.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó

                                                                                                                                                                This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                  Gaps

This invention describes the novel use of interferons (IFNs) or DNAs capable of expressing the interferons and/or antigenic proteins (AP), antigenic peptides derived from the proteins or DNAs capable of expressing the antigenic proteins or peptides, in the manufacture of an agent for induction of antigen-specific T cells. The products of the invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antigen-specific T cells. The action of interferon-alpha (IFN-alpha) in a system for inducing specific cytotoxic T cell (CTL) by administering an antigenic peptide in an incomplete Freund's adjuvant (IFA) emulsion preparation form was evaluated. IFNs (or DNA encoding IFNs) are useful in the manufacture of a medicament for inducing antigen-specific T cells in an individual who has been administered with AP (or DNA encoding AP) or vice versa. The medicament is useful for the treatment or prophylaxis of a tumor or a viral
                                                                                                                                                                                                                                                                                                                                                          ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  iņ

T
This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tumor antigenic peptide; interferon; IFN; antigen-specific T cell; virucide; cytostatic; gene therapy; IFN-alpha; cytotoxic T cell; viral infectious disease; cyclophilin B; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of antigenic proteins, peptides, interferon or their encoding the manufacture of an agent for the induction of antigen-specific
                                                                                                                                                                                                                                                                                                                                                          .

                                                                                                                                                                                                                              This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cyclophilin B; human; tumour antigen peptide; cytotoxic T-cell; CTL; HLA antigen; diagnosis; tumour; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treatment

The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours

This invention describes the novel use of interferons (IFNS) or DNAs capable of expressing the interferons and/or antigenic proteins (AP), antigenic peptides derived from the proteins or DNAs capable of expressing the antigenic proteins or peptides, in the manufacture of an agent for induction of antigen-specific T cells. The products of the
                                                                                                                                                                                       This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                      Tumor antigen peptides derived from cyclophilin 3 for treatment and diagnosis of tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumor antigenic peptide; interferon; IFN; antigen-specific T cell; virucide; cytostatic; gene therapy; IFN-alpha; cytotoxic T cell; viral infectious disease; cyclophilin B; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of antigenic proteins, peptides, interferon or their encoding the manufacture of an agent for the induction of antigen-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human cyclophilin B derived tumor antigenic peptide SEQ ID 16.

The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours

invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antigen-specific T cells. The action of interferon-alpha (IFN-alpha) in a system for inducing specific cytotoxic T cell (CTL) by administering an antigenic peptide in an incomplete Freund's adjuvant (IFA) emulsion preparation form was evaluated. IFNs (or DNA encoding IFNs) are useful in the manufacture of a medicament for inducing antigen-specific T cells in an individual who has been administered with AP (or DNA encoding AP) or vice versa. The medicament is useful for the treatment or prophylaxis of a tumor or a viral

New peptides for recognizing cancer cells with tumor specific cytotoxic lymphocytes and for treating cancer.

Claim 8; Page 2; 14pp; Japanese.

The present invention describes peptides recognising cancer cells with tumour specific cytotoxic T lymphocytes (CTL). The peptides recognising cancer cells with tumour specific CTLs are selected from: (1) peptides of sequences (AAG68066 to AAG68069); (2) peptides containing the above mentioned sequences; (3) peptides having 70 % or more of homogeneity with the above mentioned sequences; and (4) peptides with one or more deleted, substituted, added or inserted amino acid(s) of the above mentioned sequences, particularly those having recognising property due to HLA-Sequences, particularly at least 5 amino acids, used for medicine, particularly anticancer agents, derived from antitumour cantigenic peptides of lck, src family, SART-1, SART-3 or cyclophilin B genes. The antitumour peptides have cytostatic activities. The peptides are used for the treatment of cancer. The peptides cause activation of cTL in cancer patients. The present sequence represents a peptide from the present invention

Novel composition for treating a disease in an animal, comprises an immune effector cell and cell penetrating peptide associated with an antigen or antibody.

Disclosure; Page 17; 61pp; English.

The invention relates to a composition (I) comprising an immune effector cell and a cell penetrating peptide (CPP) associated with an antigen or antibody. Also included are (1) a vaccine comprising (I), CPP associated with an antigen, and apharmaceutically acceptable carrier and (2) preparing a composition for a disease, by providing (I) and CPP associated with an antigen for disease, and introducing the antigener cassociated with an antigen for disease, by providing (I) and CPP associated CPP to (I), where antigen enters into the cell. The antigens are, for example, tumour antigen for disease recognised by tumour infiltrating lymphocytes (TIL) of HLA (human leukocyte antigen) class I consist in the composition is useful for enhancing immunity in an animal to a disease, by administration, animal is protected from disease, where the animal consists both CD4+ and CD8+ T cells. It is also useful for treating a comprises both CD4+ and CD8+ T cells. It is also useful for treating a cancer, non-Hodgkin's lymphoma, leukaemia, thymoma, lymphoma, uterine cancer, non-Hodgkin's lymphoma, leukaemia, thymoma, ilmphoma, uterine cancer, cervical cancer, bladder cancer, kidney cancer, adenocarcinoma, breast cancer, prostate cancer, ovarian cancer and pancreatic cancer). The animal is further subjected to a cancer treatment including surgery, cradiation, chemotherapy or gene therapy. The administration of (I), the cancer treatment. The present sequence is a tumour antigen derived extreded extraction of the invention of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for the detection of antigen specific T cells in a blood sample involving the use of a plurality of antigenic peptides. The method comprises sampling of peripheral blood monocytes; stimulation of the collected peripheral blood monocytes with antigens without direct use of antigen presenting cells; and detection of T-cells specific to the antigen in the stimulated monocytes. The method is particularly used for the detection of cancer as it can be used in semi-used for cancer vaccine therapy for patients with cervical or prostate cancer. The method can additionally be used to monitor of cellular immunity and cancer immune therapy by detection of specific T-cell frequencies. Sequences ABR84367-ABR84380 represent HLA-A24 (human leukocyte antigen) peptides of human origin used in an example from the
                                                                                                                                                                                                                                                                                                                                                    Antigen specific T-cell; detection; diagnosis; cancer specific T-cell; cancer; tumour; cervical cancer; prostate cancer; cellular immunity; immune therapy; cytostatic; immunostimulant; vaccine; antigenic peptide; human; human leukocyte antigen; HIA-A24 epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A detection method of antigen specific T-cells, comprises the use of plural antigenic peptides, useful in semi-quantitative determination of cancer specific T-cell frequencies and for monitoring cellular immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to allergic reaction suppressors, comprising a peptide which originates from the same antigenic substance as the antigenic substance inducing the (peptide-originated) allergic reaction, and containing an epitope different from the epitope participating in the induction of the allergic reaction and yet dos not induce the allergic reaction. The desensitizers or allergic reaction suppressors are useful for treating and preventing type I allergic diseases and in cancer vaccines for preventing or treating cancer. The allergic reaction suppressors are also useful for suppressing an allergic reaction or reducing immunoglobulin E antibody production, and for desensitization to antigens. This sequence represents a peptide used in the invention and corresponds to amino acids 84-92 of the cyclophilin B protein.
                                                                                                                                                                                             cytostatic; antiallergic; vaccine; allergic reaction suppressor; antigen; allergy; epitope; cancer; immunoglobulin E antibody; desensitization; cyclophilin B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Desensitizers or allergic reaction suppressors containing peptides originating from the same antigenic substances as reaction-inducing substances, useful for preventing or treating type I allergic diseases and in cancer vaccines.

AAR72886-92 are tryptic fragments of E. coli PPIase-beta (peptidyl prolyl cis trans isomerase). The E. coli PPIase-beta has a single mol. wt. of about 20 kDa and a single isoelectric point of about 5.0. The enzyme catalyses the isomerisation of prolyl peptide bonds in proteins and accelerates the folding of the protein. The inventors are claiming the PPIase-alpha. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.) (indated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAR72930-36 are tryptic fragments of E. coli PPIase-beta (peptidyl prolyl cis trans isomerase). The E. coli PPIase-beta has a single mol. wt. of about 20 kDa and a single isoelectric point of about 5.0. The enzyme catalyses the isomerisation of prolyl peptide bonds in proteins and accelerates the folding of the protein. The inventors are claiming a PPIase-beta. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated on 16-OCT-2003 to standardise OS field)

The products of the invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antigen-specific T cells. The action of interferon-alpha (IFN-alpha) in a system for inducing specific cytotoxic T cell (CTL) by administering an antigenic peptide in an incomplete Freund's adjuvant (IFA) emulsion preparation form was evaluated. IFNS (or DNA encoding IFNS) are useful in the manufacture of a medicament for inducing antigen-specific T cells in an individual who has been administered with AP (or DNA encoding AP) or vice versa. The medicament is useful for the treatment or prophylaxis of a tumor or a viral infectious disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of antigenic proteins, peptides, interferon or their encoding DNA, in the manufacture of an agent for the induction of antigen-specific T
                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes the novel use of interferons (IFNs) or DNAs
recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                              Tumor antigenic peptide; interferon, IFN; antigen-specific T cell; virucide; cytostatic; gene therapy, IFN-alpha; cytotoxic T cell; viral infectious disease; cyclophilin B; human.

```
The present sequence comprises an epitope derived from the human CASB619 protein sequence. This protein is thought to be specifically or over-expressed in tumour cells, and so can be used as a target for antigenspecific immune responses which can cause destruction of the tumour cell. In addition, the protein and gene can be used in cancer diagnosis, in the treatment of autoimmune diseases and in vaccines against cancer and autoimmune disease. The present sequence can be used as an immunogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel CASB619 polypeptides useful for diagnosing, and as vaccines for prophylactic and therapeutic treatment of, cancers, particularly ovarian and colon carcinoma, and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antagonist; integral membrane protein; inhibitor; transmembrane domain; therapy; psychotic disorder; Huntington's disease; Parkinson's disease; post-myocardial infarction; HIV infection; cell proliferation disorder; peptic ulcer; glaucoma; asthma; renal disease; autoimmune disease; antibacterial; betal-adrenergic receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is a betal-adrenergic receptor antagonist, and is an antagonist of the invention. The antagonists (A) are for inhibiting the function of a prokaryotic or eukaryotic integral membrane protein (IMP) having at least one transmembrane domain (TMD), comprises a peptide including at least 4 consecutive amino acids (aa) from the sequence of the TMD. (A) are used to treat or prevent disorders in mammals that involve disturbances of IMP, and the same effect is achieved by inserting a nucleic acid encoding (A) into the calls of the mammal. Specified conditions that can be treated are schizophrenia, psychotic disorders, Huntington's disease, Tourette's syndrome, hypertension, post-myocardial infarction, tachyarrhythmia, human immunodeficiency virus infection, AIDS, cell proliferation (cancer, psoriasis or hyperkeratosis), and drug abuse. (A) can also be used to treat peptic ulcer, glaucoma, asthma, renal disease, Parkinson's disease, congestive heart failure, migraine, and drug antagonic in the cancer of the constitution of the cancer of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           depression, obesity, diabetic neuropathy/retinopathy, autoimmune diseases, graft rejection etc. (A) can be used as diuretics and antibacterials. (A) may also be used to determine function of orphan receptors and, when attached to a marker, for tissue imaging to localise/quantify specific receptors. The transgenic animals are used to test efficacy/toxicity of (A) and as models of diseases. (A) are very specific and selective, against the IMP from which they are derived, so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antagonist; integral membrane protein; inhibitor; transmembrane domain; therapy; psychotic disorder; Huntington's disease; Parkinson's disease;

This sequence is a betal-adrenergic receptor antagonist, and is an antagonist of the invention. The antagonists (A) are for inhibiting the function of a prokaryotic or eukaryotic integral membrane protein (IMP) having at least one transmembrane domain (TMD), comprises a peptide including at least 4 consecutive amino acids (aa) from the sequence of including at least 4 consecutive amino acids (aa) from the sequence of including at least 4 consecutive amino acids (aa) from the sequence of including at least 4 consecutive amino acids (ab from the sequence of including at least 4 consecutive amino acids (ab from the sequence of including at least 4 consecutive amino the same effect is achieved by inserting a nucleic acid encoding (A) into the cells of the mammal. Specified conditions that can be treated are schizophrenia, psychotic disorders, and infarction, tachyarrhythmia, human immunodeficiency virus infection, alboring and subsection (cancer, psoriasis or hyperkeratosis), and drug abuse. (A) can also be used to treat peptic ulcer, glaucoma, asthma, crenal disease, parkinson's disease, congestive heart failure, migraine, diseases, graft rejection etc. (A) can be used as diuretics and antibacterials. (A) may also be used to determine function of orphan receptors and, when attached to a marker, for tissue imaging to localise/quantify specific receptors. The transgenic animals are used to test efficacy/loxicity of (A) and as models of diseases. (A) are very specific and selective, against the IMP from which they are derived, so should have few side effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
post-myocardial infarction; HIV infection; cell proliferation disorder; peptic ulcer; glaucoma; asthma; renal disease; autoimmune disease; antibacterial; betal-adrenergic receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                         The present invention relates to compositions comprising a substance that modulates the status of 125P5C8 or a molecule that is modulated by 125P5C8. The status of a cell that expresses 125P5C8 is modulated. The composition is useful for treating cancer, particularly prostate, bladder, kidney, colon, ovary or breast cancer. The 125P5C8 protein and/or a nucleotide sequence encoding the protein is useful for immunising a mammal against cancer. The present sequence is a 125P5C8 epitope shown in the exemplification of the invention
                                                                                                                                                                                               125P5C8 gene or a molecule that is modulated by 125P5C8, useful for treating or preventing cancer that expresses or over expresses 125P5C8.

The present invention provides the protein sequence of a polypyrimidine tract protein isoform. Also provided are methods for modulating the stability of a CD154 RNA. The methods are useful for increasing the stability of a RNA, decreasing the stability of a RNA, preventing or treating allograft rejection in a subject, inhibiting CD40 activation in a subject, and identifying agents that modulate the level or activity of a polypyrimidine tract protein. Agents which modulate the activity of a polypyrimidine tract protein are useful to prevent or treat allograft rejection or inhibit CD40 activation. The present sequence is a nonapeptide conserved between the bovine and human polypyrimidine tract
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A new polypyrimidine tract protein isoform useful for finding agents which modulate its activity and to prevent or treat allograft rejection or CD40 activation.
                                                                                                                                                                                                                  This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cow; polypyrimidine tract protein; isoform; RNA stability regulation; immunosuppressive; allograft rejection; CD154; PTB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated Plasmodium falciparum peptide or an influenza virus peptide. The composition and methods are useful in diagnosing, preventing or treating influenza virus infection or malaria. Also disclosed is an influenza virus vaccine comprising at least one isolated Replikin present in the haemagglutinin protein of an emerging strain of influenza virus and a pharmaceutical carrier and/or adjuvant and a malaria vaccine comprising at least one isolated P. falciparum Replikin and a pharmaceutical carrier. The present sequence represents the amino acid sequence of a Replikin sequence.

The peptide preferably is modified by an acetyl or carbamyl addition at the reminus and/or amidation at the C-terminus. The peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial infections. It is particularly effective against local and systemic Candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      - useful esp for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a specifically claimed example of an anti-
-fungal and anti-bacterial D-amino acid histatin-based peptide 117, where
-fungal and anti-bacterial D-amino acid histatin-based peptide 117, where
at least one amino acid in the peptide is in the D-configuration. The
peptide is preferably modified by an acetyl or carbamyl addition at the N
-terminus and/or amidation at the C-terminus. The novel D-amino acid-
containing peptide, based on the naturally occurring histidine-rich human
compositions for the treatment of oral, vaginal, urethral, mucosal,
composition, averand ophthalmic fungal or bacterial infections. It
is particularly effective against local and systemic Candida albicans
infection, against oral bacterial diseases such as caries and
periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas
gingivalis) and against Clostridium histolyticum. The D-amino acid-
containing peptide has superior anti-fungal (especially anti-candidal)
and anti-bacterial activity, particularly on a weight basis, compared to
the natural L- amino acid forms of histatin-based peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1;

The peptide has superior anti-fungal (especially anti-Candidal) and anti-bacterial activity, particularly on a weight basin, compared to the longer, naturally occurring histatins. Peptides containing D-residues are also more resistant to degradation than L-amino acid versions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a specifically claimed peptide sequence, peptide 113-F5, where at least one amino acid is in the D-configuration. The peptide preferably is modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus. The peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial infections. It is particularly effective against local and systemic Candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g.

```
pertide 113-F4.5, where at least one amino acid is in the D-
configuration. The peptide preferably is modified by an acetyl or
carbamyl addition at the N-terminus and/or amidation at the C-terminus.

The peptide, based on the naturally occurring histidine-rich human
histatins, have anti-fungal and anti-bacterial activity and are useful in
compositions for the treatment of oral, vaginal, urethral, mucosal,
respiratory, skin, ear and ophthalmic fungal or bacterial infections. It
is particularly effective against local and systemic Candida albicans
infection, against oral bacterial diseases such as caries and
periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas
gingivalis) and against Clostridium histolyticum. The peptide has
superior anti-fungal (especially anti-Candidal) and anti-bacterial
activity, particularly on a weight basin, compared to the longer,
naturally occurring histatins. Peptides containing D-residues are also
more resistant to degradation than L-amino acid versions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Jal and anti-bacterial histatin-based peptide(s) - useful esp for Candidal infections, periodontitis and caries.
                                             Candida albicans; peridontitis; caries; tooth decay; oral infection; vaginal infection; urethral infection; mucosal infection; ear infection; respiratory infection; skin infection; ophthalmic infection; bacterial disease; Streptococcus mutans; Porphyromonas gingivalis; Clostridium histolyticum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a specifically claimed peptide sequence,
               Anti-fungal and anti-bacterial histatin-based peptide 113-F4.5.
                                                                                                                                                                                                       1. .12

The peptide preferably is modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus. The peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial infections. It is particularly effective against local and systemic Candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti-fungal and anti-bacterial histatin-based peptide(s) - useful esp for treating Candidal infections, periodontitis and caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ಡ
                             vaginal infection; urethral infection; mucosal infection; ear infection; respiratory infection; skin infection; ophthalmic infection; bacterial disease; Streptococcus mutans; Porphyromonas gingivalis; Clostridium histolyticum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Streptococcus mutans and Porphyromonas gingivalis) and against
Clostridium histolyticum. The peptide has superior anti-fungal
(especially anti-Candidal) and anti-bacterial activity, particularly o
weight basin, compared to the longer, naturally occurring histatins.
Peptides containing D-residues are also more resistant to degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Streptococcus mutans and Porphyromonas gingivalis) and against Clostridium histolyticum. The peptide has superior anti-fungal (especially anti-Candidal) and anti-bacterial activity, particularly on a weight basin, compared to the longer, naturally occurring histatins. Peptides containing D-residues are also more resistant to degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a specifically claimed peptide sequence, peptide 113, where at least one amino acid is in the D-configuration. The peptide preferably is modified by an acetyl or carbamyl addition at the reminus and/or amidation at the C-terminus. The peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial infections. It is particularly effective against local and systemic Candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g.

The present sequence represents a specifically claimed peptide sequence, peptide 113-Q3.9, where at least one amino acid is in the D-configuration. The peptide preferably is modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus.

CC carbamyl addition at the N-terminus and/or amidation at the C-terminus.

CC carbamyl addition at the N-terminus and/or amidation at the C-terminus.

CC The peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial infections. It is particularly effective against local and systemic Candida albicans infection, against oral bacterial diseases such acaries and perphyromonas constitution, and against Clostridium histolyticum. The peptide has superior anti-fungal (especially anti-Candidal) and anti-bacterial activity, particularly on a weight basin, compared to the longer, naturally occurring histatins. Peptides containing D-residues are also more resistant to degradation than L-amino acid versions
                                                                                                                                                                                                                                                                                                                                                                                                                                              - useful esp for

The present sequence represents a specifically claimed example of an anti-
-fungal and anti-bacterial D-amino acid histatin-based peptide 113, where
at least one amino acid in the peptide is in the D-configuration. The

peptide is preferably modified by an acetyl or carbamyl addition at the N-
-terminus and/or amidation at the C-terminus. The novel D-amino acid-
containing peptide, based on the naturally occurring histidine-rich human

containing peptide, based on the naturally occurring histidine-rich human

containing peptide, based on the naturally occurring histidine-rich human

compositions for the treatment of oral, vaginal, urethral, mucosal,

respiratory, skin, ear and ophthalmic fungal or bacterial infections. It

is particularly effective against local and systemic Candida albicans

composition, against oral bacterial diseases such as caries and

periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas

gingivalis) and against Clostridium histolyticum. The D-amino acid-
containing peptide has superior anti-fungal (especially anti-candidal)

and anti-bacterial activity, particularly on a weight basis, compared to

the natural L- amino acid forms of histatins and histatin-based peptides.

The presence of D-residues also makes the peptides more resistant to

degradation than corresponding L-amino acid versions
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Anti-fungal and anti-bacterial D-amino acid histatins and histatin-based peptide(s) - useful esp for treating Candidal infections, periodontitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Candida albicans; peridontitis; caries; tooth decay; oral infection; vaginal infection; urethral infection; mucosal infection; ear infection; respiratory infection; skin infection; ophthalmic infection; bacterial disease; Streptococcus mutans; Porphyromonas gingivalis;

fungal and anti-bacterial D-amino acid histatin-based peptide 113-F5,
where at least one amino acid in the peptide is in the D-configuration.

The peptide is preferably modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus. The novel D-amino acid containing peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral,

C useful in compositions for the treatment of oral, vaginal, urethral,

mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial

C andida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas gingivalis) and against clostridium histolyticum. The D-amino acid-containing peptide has superior anti-fungal (especially anti-candidal) and anti-bacterial activity, particularly on a weight basis, compared to the natural L-amino acid forms of histatins and histatin-based peptides. The presence of D-residues also makes the peptides more resistant to degradation than corresponding L-amino acid versions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a specifically claimed example of an anti

The present sequence represents a specifically claimed example of an anti-
fungal and anti-bacterial D-amino acid histatin-based peptide 113-F4,
where at least one amino acid in the peptide is in the D-configuration.

The peptide is preferably modified by an acetyl or carbamyl addition at
the N-terminus and/or amidation at the C-terminus. The novel D-amino acid
containing peptide, based on the naturally occurring histidine-rich
human histatins, have anti-fungal and anti-bacterial activity and are
useful in compositions for the treatment of oral, vaginal, urethral,
mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial
infections. It is particularly effective against local and systemic
candida albicans infection, against oral bacterial diseases such as
caries and periodontitis (by inhibiting e.g. Streptococcus mutans and
Porphyromonas gingivalis) and against Clostridium histolyticum. The D-
amino acid-containing peptide has superior anti-fungal (especially anti-
candidal) and anti-bacterial activity, particularly on a weight basis,
compared to the natural L- amino acid forms of histatins and histatin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Candida albicans; peridontitis; caries; tooth decay; oral infection; vaginal infection; urethral infection; mucosal infection; ear infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Anti-fungal and anti-bacterial D-amino acid histatins and histatin-based peptide(s) - useful esp for treating Candidal infections, periodontitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 based peptides. The presence of D-residues also makes the peptides more resistant to degradation than corresponding L-amino acid versions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present sequence represents a specifically claimed example of an anti-fungal and anti-bacterial D-amino acid histatin-based peptide 113-F4.5, where at least one amino acid in the peptide is in the D-configuration. The peptide is preferably modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus. The novel D-amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            containing peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial infections. It is particularly effective against local and systemic candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas gingivalis) and against clostridium histolyticum. The Damino acid-containing peptide has superior anti-fungal (especially anticandidal) and anti-bacterial activity, particularly on a weight basis, compared to the natural L-amino acid forms of histatins and histatinbased peptides. The presence of D-residues also makes the peptides more resistant to degradation than corresponding L-amino acid versions
                                                                                                                                                                                                                                                                                                                                                                                                                                                       l and anti-bacterial D-amino acid histatins and histatin-based - useful esp for treating Candidal infections, periodontitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Candida albicans; peridontitis; caries; tooth decay; oral infection;
respiratory infection; skin infection; ophthalmic infection; bacterial disease; Streptococcus mutans; Porphyromonas gingivalis; Clostridium histolyticum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

fungal and anti-bacterial D-amino acid histatin-based peptide 113-Q3.9,
where at least one amino acid in the peptide is in the D-configuration.
The peptide is preferably modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus. The novel D-amino acid containing peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, according in the particularly effective against local and systemic candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas gingivalis) and against Clostridium histolyticum. The D-amino acid-containing peptide has superior anti-fungal (especially anti-candidal) and anti-bacterial activity, particularly on a weight basis, compared to the natural L-amino acid forms of histatins and histatin-based peptides. The presence of D-residues also makes the peptides more resistant to degradation than corresponding L-amino acid versions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ij

This invention describes novel substantially pure antibacterial and antifungal peptides (A) containing between 13 and 20 amino acids, where the peptide has the amino acid sequence: R1-R2-R3-R4-R5-R6-R7-R8-R9-R10-CC R11-R12-R13-R14-R15-R16-R17-R18-R19-R20-R21-R22-R23; where: R1 is Asp or absent; R2 and R20 are Ser or absent; R3, R18, R19 and R21 are His or absent; R4 is Ala; R5, R6, R9, R12, R13, are Lys, G10, Arg or another CC basic amino acid; R7, R8 and R15 are His, Phe, Tyr, Leu, another hydrophobic amino acid, or is absent; R10 is Tyr; R16 is G10 or absent; R17 is Lys or absent; R22 is Arg or absent; R23 is G1y or absent; where CC anino acid sequence. (A) can be used to treat fungal or bacterial amino acid sequence. (A) can be used to treat fungal or bacterial candidal infection, as well as bacterial and viral infections, especially veginal, urethral, mucosal, respiratory, skin, ear, oral, or ophthalmic candida albicans, Actinomyces actinomycetemcomitans, Actinomyces caused by candida albicans, Actinomyces actinomycetemcomitans, Actinomyces viscosus, Bacteriodes forsythus, Bacteriodes gracilis, Bacteriodes vesous, Bacteriodes forsythus, Capnocytophaga gingivalis, Campylobacter sputorum, Capnocytophaga gingivalis, Campylobacter sputorum, Pusobacterium aucideatum, Eusobacterium aucideatum, Fusobacterium constant aucideatum, Fusobacterium constant aucideatum, Pusobacterium aucideatum, Pusobacterium constant aucideatum aucideatum, Eusobacterium aucideatum, Eusopaceatum, Eus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

                                                                                                                                                                                                                                                                                                  antifungal peptides (A) containing between 13 and 20 amino acids, where the peptide has the amino acid sequence: R1-R12-R3-R4-R5-R6-R7-R8- R9-R10-R11-R12-R13-R14-R15-R16-R17-R18-R19-R20-R21-R22-R23; where: R1 is Asp or absent; R2 and R20 are Ser or absent; R3, R18, R19 and R21 are His or absent; R4 is Ala; R5, R6, R9, R12, R13, are Lys, Gln, Arg or another basic amino acid; R7, R8 and R15 are His, Phe, Tyr, Leu, another conversed or is absent; R10 is Tyr; R16 is Glu or absent; R17 is Lys or absent; R22 is Arg or absent; R2; R6, R12, and R13 of the amino acid sequence. (A) can be used to treat fungal or bacterial candidal infection, as well as bacterial and viral infections, especially vaginal, urethral, mucosal, respiratory, skin, ear, oral, or ophthalmic infections. The infections that can be treated include those caused by candida albicans, Actinomyces actinomycetemcomitans, Actinomyces viscosus, Bacteriodes gracilis, Bacteriodes

This invention describes novel substantially pure antibacterial and antifungal peptides (A) containing between 13 and 20 amino acids, where the peptide has the amino acid sequence: R1-R2-R3-R4-R5-R6-R7-R8- R9-R10-R11-R12-R13-R14-R15-R16-R17-R18-R19-R20-R21-R22-R23; where: R1 is Asp or absent; R2 and R20 are Ser or absent; R3, R18, R19 and R21 are His or absent; R4 is Ala; R5, R6, R9, R12, R13, are Lys, Gln, Arg or another basic amino acid; R7, R8 and R15 are His, Phe, Tyr, Leu, another hydrophobic amino acid, or is absent; R10 is Tyr; R16 is Glu or absent; R17 is Lys or absent; R22 is Arg or absent; R23 is Gly or absent; where Gln cannot simultaneously occupy positions R5, R6, R12, and R13 of the amino acid sequence. (A) can be used to treat fungal or bacterial infection in a mammal. The peptides are particularly used to treat candidal infection, as well as bacterial and viral infections, especially vaginal, urethral, mucosal, respiratory, skin, ear, oral, or ophthalmic infections. The infections that can be treated include those caused by infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Candida albicans, Actinomyces actinomycetemcomitans, Actinomyces viscosus, Bacteriodes forsythus, Bacteriodes gracilis, Bacteriodes ureolyticus, Campylobacter concisus, Campylobacter rectus, Campylobacter showae, Campylobacter sputorum, Capnocytophaga gingivalis, Capnocytophaga ochracea, Capnocytophaga sputigena, Clostridium histolyticum, Eikenella corrodens, Eubacterium nodatum, Fusobacterium nucleatum, Fusobacterium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    peridonticum, Peptostreptococcus nicros, Porphyromonas endodontalis, Porphyromonas gingivalis, Prevotella intermedia, Prevotella nigrescens, Propionibacterium acnes, Pseudomonas aeruginosa, and those caused by various Staphylococcal and Streptococcal species. The invention relates to treating cystic fibrosis via the administration of a histatin, or a histatin, related peptide. The peptide that is administered contains between 8 and 20 amino acids and has the sequence: X1-X2-X3-X4-X5-X6-X7-X8-X9-X10-X11-X12-X13-X14-X15-X16-X17-X18-X19-X20-X21-X22-X23 where X1 is Asp or absent; X2 is Ser or absent; X3 is His or absent; X4 is Ala, His, Leu, or absent; X5 is Lys, another basic amino acid; X6 is Arg, Gln, Lys, or another basic amino acid; X6 is Arg, Gln, Lys, or another basic amino acid; X6 is Arg, Gln, Lys, or another basic amino acid; X10 is Tyr; X11 is Lys, CT, y15, Ly, Ly, Arg, Ser, or a basic amino acid; X10 is Tyr; X11 is Lys, CT, or another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X13 is Lys, Gln, Arg, Orn, another basic amino acid; X14 is Phe or absent; X15 is His or absent; X16 is Glu or absent; X17 or absent; X21 is His or absent; X22 is Arg or absent; A22 is A23 is Gly or absent. Optionally, the peptide may contain at least one modification and a C-terminal amide addition, an N-terminal carbamyl addition and a C-terminal amide addition, Histatin, histatin fragments armining and histatin-related peptides have activity against Promise Histations and other pulmonary infections in cystic fibrosis patients. Such infections are often resistant to the antibiotics normally used to treat the exemplifications of the invention. With the 7.10 (AABI1988), all these peptides showed aeruginosa. They may therefore be used to combat Pseudomonas infections and other pulmonary infections in cystic fibrosis nationts. pulmonary infections. Sequences AAB11985-B11993 represent relation related peptides used in the exemplifications of the invention. Wit exception of P-113-Q2.3.9.10 (AAB11988), all these peptides showed activity against Pseudomonas aeruginosa

The invention relates to treating cystic fibrosis via the administration of a histatin, a fragment of histatin, or a histatin-related peptide. The peptide that is administered contains between 8 and 20 amino acids and has the sequence: X1-X2-X3-X4-X5-X6-X7-X8-X9-X10-X11-X12-X13-X14-X15-X16-X17-X18-X19-X20-X21-X22-X23 where X1 is Asp or absent; X2 is Ser or absent; X3 is His or absent: X4 is Ala, His, Leu or absent; X5 is Lys, C1n, Arg, Orn, or another basic amino acid; X6 is Arg, G1n, Lys, or another basic amino acid; X7 is His, Phe, Tyr Leu, or another hydrophobic amino acid; X8 is His, Phe, Tyr Leu, or another hydrophobic amino acid; X8 is His, Phe, Tyr Leu, or another hydrophobic amino acid; X10 is Lys, G1n, Arg, C1n, or another basic amino acid; X13 is Lys, G1n, Arg, C1n, or absent; X14 is Phe or absent X15 is His, Phe, Tyr, C1cu, another hydrophobic amino acid, or absent X16 is G10 or absent; X10 is Lys or absent; X10 is His or absent; X20 is Ser or absent; X21 is His or absent; X20 is Arg or absent; X21 is His or absent; X21 is His or absent; X22 is Arg or absent; Andition and a C-terminal acid addition, an N-terminal carbamyl addition, and a C-terminal amide addition, an N-terminal carbamyl addition, and a C-terminal amide addition, Histatin, histatin-related peptides have activity against Pseudomonas and other pulmonary infections in cystic fibrosis patients. Such cuffections are often resistant to the antibiotics normally used to treat or unlmonary infections. Semiances AARI1974-R11844 represent specifically. Treating cystic fibrosis and combating Pseudomonas and other pulmonary infections in a mammal comprises administering histatin or a fragment of pulmonary infections. Sequences AAB11976-B11984 represent specifically claimed histatin-related peptides for use in the method of the invention. The present sequence corresponds to residues 4-15 of naturally-occurring human histatin 3 and histatin 5 (AAB11974, AAB11975) Histatin-related peptide; cystic fibrosis; Pseudomonas aeruginosa; antibiotic resistance; pulmonary infection; antibacterial; antibiotic. The invention relates to treating cystic fibrosis via the administration of a histatin, a fragment of histatin, or a histatin-related peptide. The peptide that is administered contains between 8 and 20 amino acids and 20 mas the sequence: X1-X2-X3-X4-X5-X6-X7-X8-X9-X1-X11-X12-X13-X14-X15-X16-X17-X18-X19-X20-X21-X22-X23 where X1 is Asp or absent; X2 is Ser or absent; X3 is H1s or absent; X4 is Ala, H1s, Leu or absent; X3 is Lys, Cl. or another basic amino acid; X6 is Asy, Gll, Lev, or another basic amino acid; X7 is H1s, Phe, Tyr Leu, or another hydrophobic amino acid; X9 is Gly, Lys, Arg, Ser, or a basic amino acid; X10 is Tyr; X11 is Lys, Cl. or, or another hydrophobic amino acid; X1 is Las, Cl. or another basic amino acid; X1 is Lys, Gln, Arg, Orn, another hydrophobic amino acid; X1 is Lys, Gln, Arg, Orn, another basic amino acid, X1 is Phe or absent X15 is H1s, Phe, Tyr, Leu, or another basic amino acid, X1 is Phe or absent; X10 is Lys, Cl. or absent; X11 is H1s or absent; X14 is H1s or absent; X15 is Gly or absent; X21 is H1s or absent; X19 is H1s or absent; X10 is Ser or absent; X21 is H1s or absent; X19 is H1s or absent; X21 is H1s or absent; X19 is H1s or absent; X19 is H1s or absent; X20 is Ser or absent; X21 is H1s or absent; X19 is H1s or absent; X19 is H1s or absent; X20 is Ser or absent; X21 is H1s or absent; X19 is H1s or absent; X20 is Ser or absent; X21 is H1s or absent;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating cystic fibrosis and combating Pseudomonas and other pulmonary infections in a mammal comprises administering histatin or a fragment of

Specifically, it refers to the synthesis of the protegrin IB-367 peptide by a hybrid process, which comprises carrying out both solid phase synthesis as well as liquid phase synthesis methods. The present invention describes synthesising specific side chain protected peptide fragment intermediates using non-protected arginine reagents, and deprotecting the side chain protected peptide. The protegrin IB-367 peptide is active in vitro and in vivo against microflora, such that it is described as having antibacterial properties and can be used for treating oral mucositis. Furthermore it is useful for coupling to therapeutic agents, reporter molecules, diagnostic agents and antibody molecules. This peptide sequence is the histatin peptide (SeqID 22), synthesised by the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This sequence represents residues 9-22 of human histatin 3. These peptides are used to treat or prevent infection by Candida albicans in human or veterinary medicine. These peptides are more active than native histatins. These peptides were tested in three assays designed to measure separately their effectiveness in killing of blastoconidia, in killing of germinated cells, and in inhibiting the germination of C. albicans. For these assays, human histatin 3 was isolated from human parotid salivary secretions, and macaque histatin 1 was chemically synthesised. Compositions containing these peptides may also be used in the treatment of bacterial infections, e.g. Streptococcus mutans or P. gingivalis, or viral infections, e.g. Herpes simplex or HIV-1. (Updated on 25-MAR-2003 to correct PF field.)

The present sequence represents histatin 104, found in human paratoid secretion, where at least one amino acid is in the D-configuration. The secretion, where at least one amino acid is in the D-configuration. The peptide preferably is modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus. The peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and of oral, vaginal or bacterial infections. It is particularly effective against local and systemic Candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas gingivalis) and against clostridium histolyticum. The peptide has superior anti-fungal (especially anti-Candidal) and anti-bacterial activity, particularly on a weight basin, compared to the longer, naturally occurring histatins.

Peptides containing D-residues are also more resistant to degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1,

This is a human histatin 3 based peptide 3P4. Histatin is a histidine rich salivary protein. This peptide and other peptides based on human histatin 3 and macaque histatins can be synthesised for treatment of fungal, in particular, candidal infections. Expression vectors encoding these peptides can be used in antifungal treatment methods. They can be used to treat candidiasis, fungal infections of the oral cavity, vagina, urethra and skin and systemic fungal infections
              Histatin 3; macaque; human; treatment; fungal infection; candidiasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a specifically claimed example of an anticulary and anti-bacterial D-amino acid histatin-based peptide 104, where at least one amino acid in the peptide is in the D-configuration. The peptide is preferably modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus. The novel D-amino acid-containing peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial infections. It is particularly effective against local and systemic Candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas gingivalis) and against Clostridium histolyticum. The D-amino acide containing peptide has superior anti-fungal (especially anti-candidal) and anti-bacterial activity, particularly on a weight basis, compared to the natural L-amino acid forms of histatins and histatin-based peptides. The presence of D-residues also makes the peptides more resistant to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Η;

                                                                This peptide is an example of a peptide which binds to a human leucocyte antigen HLA-DQ4 molecule. The peptide was isolated from a phagemid combinatorial library comprising the sequence AAV05953, by screening with an HLA-DQ4 molecule. The peptide is used for the treatment of autoimmune disease, or especially for treatment of viral diseases
